PROBLEM

Employee support requests were spread across chat, email, and manual forms. The process needed faster classification, structured case capture, guided follow-up, and reliable handoff to support teams.

APPROACH

Designed a Copilot Studio agent with topic routing, AI-assisted intent classification, Power Automate workflows, Dataverse-style case records, Adaptive Card notifications, and feedback telemetry.

WORKFLOW DESIGN

Created sample workflows for intent routing, case creation, human handoff, and feedback logging. Each workflow uses structured JSON payloads so the design can be reviewed like a real implementation without exposing production assets.

UI PREVIEW

Prepared a dummy operations dashboard for routed intents, open cases, handoff queue, confidence score, and recent conversation context.

MY CONTRIBUTION

Conversation design, workflow architecture, payload mapping, Adaptive Card structure, L2/L3 escalation logic, telemetry fields, test scenarios, and deployment runbook.

SKILLS

Copilot Studio, Power Automate, Dataverse, Power Apps, Adaptive Cards, Azure OpenAI, Azure AI intent routing concepts, REST APIs, JSON, Power BI, App Insights, Agile/Scrum.
